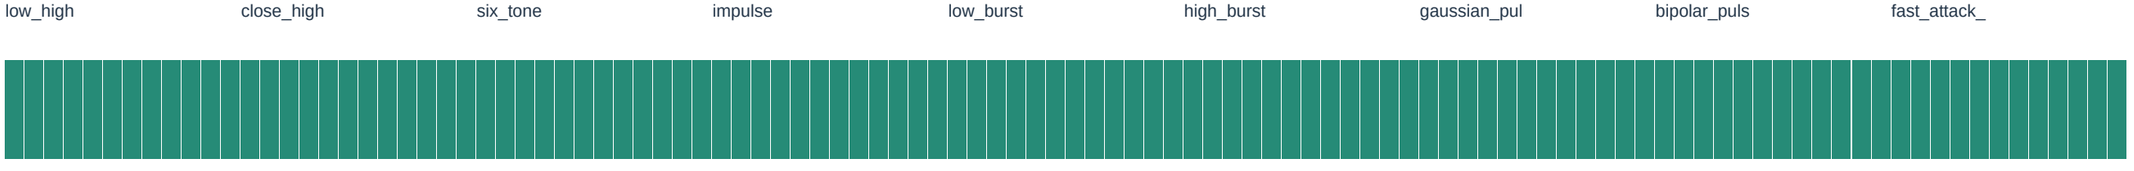
# Voltage-driven transformer: fresh audio validation

108/108 pass; 108/108 converged DC-20 kHz references. Offline circuit only; live plugin unchanged.



Each signal: 44.1/48/96/192 kHz, input peaks 0.05/1/4. Green pass; orange miss; gray reference unresolved.

Input voltage now drives a solved magnetic circuit. These results do not inherit the prior prescribed-field quartic scores.
